EDUCATION

Master's in Applied Data Science

GPA - 3.70

University of Michigan - Ann Arbor

Aug 2024 - Aug 2025

Ann Arbor, MI

Bachelor's of Science in Computer Science and Engineering

GPA - 3.26

University of Toledo

Aug 2019 - Dec 2023

Toledo, OH

WORK EXPERIENCE

Research Assistant

University of Michigan

June 2025 - August 2025

Ann Arbor, MI

- Conducted exploratory research on large language models, Retrieval-Augmented Generation (RAG), and natural language processing to enhance narrative generation by weighting story characteristics for dynamic storytelling.
- Prototyped RAG-based storytelling systems that incorporated custom weighting strategies based on narrative elements, enabling the creation of context-aware, restructured stories.
- Integrated multiple OAuth authentication providers into an existing web application, upgrading legacy authentication flows and modernizing backend dependencies.
- Managed a NoSQL MongoDB instance, performing data manipulation and access control to fulfill evolving user feature requests and maintain schema integrity.

AI Developer

Integrated Informatics

October 2025 – Present

Atlanta, GA

- Developed Python applications and C# Web APIs to streamline workflows and enhance user experience for healthcare users.
- Built an automated web scraper and form filler using Playwright (Python) to reduce manual input and improve data accuracy.
- Utilized LLM APIs to enhance the automated web scraper and a patient eligibility determination program, improving accuracy and user interaction.
- Collaborated with cross-functional teams to optimize clinic software performance and deliver scalable AI-driven solutions.

PROJECTS

Brain Sleep Dashboard

Jan 2025 – Aug 2025

Contributed to the development of an interactive data visualization dashboard examining the link between sleep deprivation and mental health using brain signal data and national survey health data. Built feature components to display brain activity, mood, demographic trends, and test reaction times.

Multi-Model Exploration of Depression Risk

Jan 2025 – May 2025

This project investigates the use of machine learning to predict depression severity based on self-reported mental health assessments and demographic features. We developed a supervised learning pipeline to classify individuals into depression severity categories and to estimate PHQ-9 total scores using models such as logistic regression, random forest, and support vector machines.

TECHNICAL SKILLS

Languages | Python, C#, Javascript, C/C++, SQL, NoSQL, HTML/CSS

Tools and Frameworks | MongoDB, Google Cloud Provider, Prisma, Auth0, Git, React, Node.js, Flask, PlayWright, Gen AI APIs

Relevant Coursework | Data Manipulation, Big Data, Efficient Data Processing, Deep Learning, Machine Learning Pipelines, Network Analysis, Applied Natural Language Processing, SQL and Databases

Libraries | Pandas, NumPy, Matplotlib, Altair, TensorFlow, OAuth, Scikit-learn
